Ability to understand the prompt the user enters.
example: "Test youtube.com, search for a video about horses, and verify horses are seen on the video"

Steps. Example:
Given system resolution is set to 1920x1080
Given user goes to "youtube.com"
And user use search bar to search for "horses"
then next page /results contains horses related videos

noodle-engine: test step generator
report generator
self-heal
prompt handler

Engine

noodle init

Terminal

Noode-Agent

Noode-agent is the main prompt handler, this is where user can use to generate test cases, execute commands lik run test, generate report.

noodle-agent can use local llm OR Claude, copilot

NOODLE

Automation framework that handles the coding logic.

User only has to
1.) Prompt the tc
2.) Write the tc in .feature (Gherkin)

Noodle needs to be able to be agentic.

Report Generator

OUTPUT (After test runs)

Note: Any failed steps must contain the screenshot, logs and stacktrace

Screenshots of failed tests
Video?? (Compressed)
Attach

How to show in AZURE DevOps

REPORTS
Allure Report (WEB, Android, iOS)
RCA (ALL)
Custom HTML? (Native Applications)

Auto serve?
Auto host

Logs
Network logs
Stack trace
Agent logs

Attach logs in Report

~/workspace/noode
~/workspace/test_app

noodle can test the test-app.

test app contains
- .feature files
- .env files
- secrets
- Pom yaml

test app is auto generated by noodle-agent if user prompts a new test.

Noodle Capabilities
1.) Able to set Screen Resolution
  - Given system's resolution is {1920x1080} (Parameter)
2.) User able to write .feature
3.) .feature can be generated via prompt
  - Noodle-Agent (noodle-agent)
    - noodle-agent: can be set up with local llm or other llm ← noodle-agent be the primary entry point
4.) Can auto-generate environment files, Pom.yaml, Secrets files, etc (at least templates)
5.) Generate the Reports.
6.) Noodle can I.O
  - 1.) Interact with web applications
  - 2.) Interact with emulated devices (android, iOS)
  - 3.) Interact with native applications (.exe, macOSX apps)
7.) Noode can
  - 1.) Handle complex .feature file Steps.
    - Example
      - 1.) able to set screen resolution
      - 2.) Able to run python scripts.
      - 3.) Able to handle step dependency injection
      - 4.) Able to store variable generated by the step.
      - 5.) Able to perform clicks, getText, sendText, hover, wait for element etc (All selenide controls)
      - 6.) Able to perform assertions on the page or the return value done by the steps.
      - 7.) Able to perform Smart waits.

Noode-agent

1.) Main entry point
2.) LLM (ollama default but can change)
3.) With noodle-engine, noodle-agent can decipher user prompts to generate the desired test steps.
  - ↑ noodle-engine LLM?
4.) LLM to help generate the steps, supporting scripts, or even web crawl.
